CONNECTAL DEVELOPER'S GUIDE

Contents:

1.1 Connectal Project Structure

The set of files composing the input to the Connectal toolchain is referred to as a project. A collection of out-of-tree example projects is available at <https://github.com/connectal-examples>. To illustrate the structure of a project, this chapter uses the example <https://github.com/connectal-examples/leds>, which can be executed using the Bluesim or Zynq target platforms.

1.1.1 Project Makefile

The top-level Makefile (<https://github.com/connectal-examples/leds/blob/master/Makefile>) defines parameters building and executing the project. In its simplest form, it specifies which Bluespec interfaces to use as portals, the hardware and software source files, and the libraries to use for the hardware and software compilation:

```
INTERFACES = LedControllerRequest
BSVFILES = LedController.bsv Top.bsv
CPPFILES= testleds.cpp
NUMBER_OF_MASTERS =0
include \$(CONNECTALDIR)/Makefile.connectal
```

INTERFACES is a list of names of BSV interfaces which may be used to communicate between the HW and SW components. In addition to user-defined interfaces, there are a wide variety of interfaces defined in Connectal libraries which may be included in this list.

BSVFILES is a list of bsv files containing interface definitions used to generate portals and module definitions used to generate HW components. Connectal bsv libraries can be used without being listed explicitly.

CPPFILES is a list of C/C++ files containing software components and main. The Connectal C/C++ libraries can be used without being listed explicitly.

NUMBER_OF_MASTERS is used to designate the number of host bus masters the hardware components will instantiate. For PCIe-based platforms, this value can be set to 0 or 1, while on Zynq-based platforms values from 0 to 4 are valid.

CONNECTALDIR must be set so that the top-level Connectal makefile can be included. This brings in the default definitions of all project build parameters as well as the Connectal hardware and software libraries. When running the toolchain on AWS, this variable is set automatically in the build environment. (hyper-ref[compiling_a_project][Section-ref{compiling_a_project}])

1.1.2 Project Source

Interface Definitions

label{interface_definitions}

When generating portals, the Connectal interface compiler searches the Connectal bsv libraries and the files listed in BSVFILES for definitions of all the interfaces listed in INTERFACES. If an the definition of a listed interfaces is not found, an error is reported the the compilation aborts. The interfaces in this list must be composed exclusively of Action methods. Supported method argument types are Bit\#(n), Bool, Int\#(32), UInt\#(32), Float, Vector\#(t), enum, and struct.

Software

The software in a Connectal project consists of at least one C++ file which instantiates the generated portal wrappers and proxies and implements main(). The following source defines the SW component of the example, which simply toggles LEDs on the Zedboard ([url{https://github.com/connectal-examples/leds/blob/master/testleds.cpp}](https://github.com/connectal-examples/leds/blob/master/testleds.cpp)):

```
#include <unistd.h>
#include "LedControllerRequest.h"
#include "GeneratedTypes.h"
int main(int argc, const char **argv)
{
    LedControllerRequestProxy *device =
        new LedControllerRequestProxy(IfcNames_LedControllerRequest);
    for (int i = 0; i < 20; i++) {
        device->setLeds(10, 10000);
        sleep(1);
        device->setLeds(5, 10000);
        sleep(1);
    }
}
```

The makefile listed LedControllerRequest as the only communication interface. The generated proxies and wrappers for this interface are in LedControllerRequest.h which is included, along with C++ implementations of all additional interface types in GeneratedTypes.h. Line 9 instantiates the proxy through which the software invokes the hardware methods ([hyperref\[flow_control\]{Section~ref{flow_control}}](#)).

1.1.3 Hardware

Connectal projects typically have at least one BSV file containing interface declarations and module definitions. The implementation of the interfaces and all supporting infrastructure is standard BSV. Interfaces being used as portals are subject to the type restrictions described earlier ([hyperref\[interface_definitions\]{Section~ref{interface_definitions}}](#)).

Top.bsv

In Top.bsv (<https://github.com/connectal-examples/leds/blob/master/Top.bsv>), the developer instantiates all hardware modules explicitly. Interfaces which can be invoked through portals need to be connected to the generated wrappers and proxies. To connect to the host processor bus, a parameterized standard interface is used, making it easy to synthesize the application for different CPUs or for simulation:

```
// Connectal Libraries
import CtrlMux::*;
import Portal::*;
```

```

import Leds::*;
import MemTypes::*;
import MemPortal::*;
import HostInterface::*;
import LedControllerRequest::*;
import LedController::*;

typedef enum {LedControllerRequestPortal} IfcNames deriving (Eq,Bits);

module mkConnectalTop(StdConnectalTop#(PhysAddrWidth));
  LedController ledController <- mkLedControllerRequest();
  LedControllerRequestWrapper ledControllerRequestWrapper <-
    mkLedControllerRequestWrapper(LedControllerRequestPortal,
    ledController.request);

  Vector#(1,StdPortal) portals;
  portals[0] = ledControllerRequestWrapper.portalIfc;
  let ctrl_mux <- mkSlaveMux(portals);

  interface interrupt = getInterruptVector(portals);
  interface slave = ctrl_mux;
  interface masters = nil;
  interface leds = ledController.leds;
endmodule

```

Like the SW components, the HW begins by importing the generated wrappers and proxies corresponding to the interfaces listed in the project Makefile. The user-defined implementation of the `LedControllerRequest` interface is instantiated on line 14, and wrapped on line 15. This wrapped interface is connected to the bus using the library module `mkSlaveMux` on line 21 so it can be invoked from the software. At the end of the module definition, the top-level interface elements must be connected. A board-specific top-level module will include this file, instantiate `mkConnectalTop` and connect the interfaces to the actual peripherals. The name of the file must be `Top.bsv` and the name of the module must be `mkConnectalTop`.

The Bluespec compiler generates a Verilog module from the top level BSV module, in which the methods of exposed interfaces are implemented as Verilog ports. Those ports are associated to physical pins on the FPGA using a physical constraints file. If CPU specific interface signals are needed by the design (for example, extra clocks that are generated by the PCIe core), then an optional CPU-specific interface can also be used. If the design uses multiple clock domains or additional pins on the FPGA, those connections are also made here by exporting a ‘Pins’ interface (`hyperref[host_interface]{Section~ref{host_interface}}`).

1.2 Compiling and Running Connectal Project

1.2.1 Compiling on ConnectalBuild

The Connectal toolchain can be run on ConnectalBuild using the following Buildbot web interface: <http://connectalbuild.grclab.com/projects>.

begin{figure}[!h]

centering

includegraphics[width=0.75textwidth]{connectalbuild.pdf}

end{figure}

Before submitting a project, you must sign in using your github credentials. We do not store credentials, but pass them through to github. Next, enter a name for the project, which will be used for subsequent build requests through

the Buildbot web interface. The project must be in a publicly accessible git-hub repository, whose Repo location is entered beginning with `git://` as follows `git://github.com/connectal-examples/leds.git`. If the project makefile is not in the root directory of the repository, enter its relative path in the 'Path' field of the form. If a particular branch or revision number are desired, enter these as well. Check the button to select the build target. If you have selected a zynq-based platform and would like the tool-chain to automatically program the device and execute the design as its final step, then enter the IP address of your board. This works only because `adb` doesn't require authentication. SSH keys required to run on PCIe-based platforms are not currently supported. Finally, don't forget to click 'Add'. If the project name has already been used, you will be prompted to enter a new one at this point.

1.2.2 Compiling Locally

Before compiling a project locally, you will need to install the toolchain. After setting the `CONNECTALDIR` to the root of the connectal source tree, enter the command 'Make

1.2.3 Executing The Design

CONNECTAL BSV LIBRARIES

2.1 Address Generator

One of the common patterns that leads to long critical paths in designs on the FPGA are counters and comparisons against counters. This package contains a module for generating the sequence of addresses used by a memory read or write burst, along with a field indicating the last beat of the burst.

struct AddressGenerator :: **AddrBeat#**(**numeric type** addrWidth)

addr → Bit#(addrWidth)
The address for this beat of the request.

bc → Bit#(BurstLenSize)

tag → Bit#(MemTagSize)

last → Bool

interface AddressGenerator :: **AddressGenerator** (*numeric type* addrWidth, *numeric type* dataWidth)

request → Put#(PhysMemRequest#(addrWidth))
The interface for requesting a sequence of addresses.

addrBeat → Get#(AddrBeat#(addrWidth))
The interface for getting the address beats of the burst. There is one pipeline cycle from the request to the first address beat.

module AddressGenerator :: **mkAddressGenerator** → (AddressGenerator#(addrWidth, dataWidth))
Instantiates an address generator.

2.2 Arith Package

The Arith package implements some functions that correspond to infix operators.

function Arith :: **booland** (*Bool* x1, *Bool* x2) → Bool
Returns logical “and” of inputs. Named to avoid conflict with the Verilog keyword “and”.

function Arith :: **boolor** (*Bool* x1, *Bool* x2) → Bool
Returns logical “or” of inputs. Named to avoid conflict with the Verilog keyword “or”.

function Arith :: **eq** (*a* x1, *a* x2) → Bool

function Arith :: **add** (*a* x1, *a* x2) → a
Returns sum of inputs. Requires Arith#(a).

function Arith: **:mul** (*a x1, a x2*) → a
Returns product of inputs. Requires Arith#(a).

function Arith: **:rshift** (*Bit#(b) x1, Integer i*) → Bit#(b)
Returns input right shifted by i bits.

function Arith: **:a) vadd** (*Vector#(n, a) x1, Vector#(n, a) x2*) → Vector#(n,
Returns sum of input vectors.

function Arith: **:a) vmul** (*Vector#(n, a) x1, Vector#(n, a) x2*) → Vector#(n,
Returns element-wise product of input vectors.

function Arith: **:Bit# (b)) vrshift**(*Vector#(n, Bit#(b)) x1, Integer i*) → Vector#(n,
Right shifts the elements of the input vector by i bits.

2.3 CtrlMux Package

module CtrlMux: **:mkInterruptMux** (*Vector#(numPortals, MemPortal#(aw, dataWidth)) portals*) →
(ReadOnly#(Bool))
Used by BsimTop, PcieTop, and ZynqTop. Takes a vector of MemPortals and returns a boolean indicating whether any of the portals has indication method data available.

module CtrlMux: **:mkSlaveMux** (*Vector#(numPortals, MemPortal#(aw, dataWidth)) portals*) → (Phys-
MemSlave#(addrWidth,dataWidth))
Takes a vector of MemPortals and returns a PhysMemSlave combining them.

2.4 HostInterface Package

The HostInterface package provides host-specific typedefs and interfaces.

2.4.1 Host-Specific Constants

typedef HostInterface: **:DataBusWidth**
Width in bits of the data bus connected to host shared memory.

typedef HostInterface: **:PhysAddrWidth**
Width in bits of physical addresses on the data bus connected to host shared memory.

typedef HostInterface: **:NumberOfMasters**
Number of memory interfaces used for connecting to host shared memory.

2.4.2 Host-Specific Interfaces

interface HostInterface: **:BsimHost**
Host interface for the bluesim platform

interface HostInterface: **:PcieHost**
Host interface for PCIe-attached FPGAs such as vc707 and kc705

interface HostInterface: **:ZynqHost**
Host interface for Zynq FPGAs such as zedboard, zc702, zc706, and zybo.
The Zc706 is a ZynqHost even when it is plugged into a PCIe slot.

2.5 Leds Package

interface Leds : **Leds**

typedef Leds : **LedsWidth**

Defined to be the number of default LEDs on the FPGA board.

The Zedboard has 8, Zc706 has 4, ...

Leds : **leds** → Bit#(LedsWidth)

2.6 MemPortal Package

2.6.1 mkMemPortal Module

module MemPortal : **mkMemPortal** (*Bit#(slaveDataWidth) ifcId, PipePortal#(numRequests, numIndications, slaveDataWidth) portal*) → (MemPortal#(slaveAddrWidth, slaveDataWidth))

Takes an interface identifier and a PipePortal and returns a MemPortal.

2.7 MemreadEngine Package

module MemreadEngine : **mkMemreadEngine** (**MemreadEngineV** (*dataWidth, cmdQDepth, numServers*))

Creates a MemreadEngine with default 256 bytes of buffer per server.

module MemreadEngine : **mkMemreadEngineBuff** (*Integer bufferSizeBytes*) → (MemreadEngineV#(dataWidth, cmdQDepth, numServers))

Creates a MemreadEngine with the specified buffer size.

2.8 MemTypes Package

2.8.1 Constants

typedef MemTypes : **Bit#(32) SGLId**

typedef MemTypes : **44 MemOffsetSize**

typedef MemTypes : **6 MemTagSize**

typedef MemTypes : **8 BurstLenSize**

typedef MemTypes : **32 MemServerTags**

2.8.2 Data Types

struct MemTypes : **PhysMemRequest#(numeric type addrWidth)**

A memory request containing a physical memory address

addr → Bit#(addrWidth)

Physical address to read or write

burstLen → Bit#(BurstLenSize)

Length of read or write burst, in bytes. The number of beats of the request will be the burst length divided by the physical width of the memory interface.

tag → Bit#(MemTagSize)

struct MemTypes :: **MemRequest**

A logical memory read or write request. The linear offset of the request will be translated by an MMU according to the specified scatter-gather list.

sglId → SGLId

Indicates which scatter-gather list the MMU should use when translating the address

offset → Bit#(MemOffsetSize)

Linear byte offset to read or write.

burstLen → Bit#(BurstLenSize)

Length of read or write burst, in bytes. The number of beats of the request will be the burst length divided by the physical width of the memory interface.

tag → Bit#(MemTagSize)

struct MemTypes :: **MemData#(numeric type dsz)**

One beat of the payload of a physical or logical memory read or write request.

data → Bit#(dsz)

One data beat worth of data.

tag → Bit#(MemTagSize)

Indicates to which request this beat belongs.

last → Bool

Indicates that this is the last beat of a burst.

2.8.3 Physical Memory Clients and Servers

interface MemTypes :: **PhysMemSlave** (*numeric type addrWidth, numeric type dataWidth*)

read_server → PhysMemReadServer#(addrWidth, dataWidth)

write_server → PhysMemWriteServer#(addrWidth, dataWidth)

interface MemTypes :: **PhysMemMaster** (*numeric type addrWidth, numeric type dataWidth*)

read_client → PhysMemReadClient#(addrWidth, dataWidth)

write_client → PhysMemWriteClient#(addrWidth, dataWidth)

interface MemTypes :: **PhysMemReadClient** (*numeric type asz, numeric type dsz*)

readReq → Get#(PhysMemRequest#(asz))

readData → Put#(MemData#(dsz))

interface MemTypes :: **PhysMemWriteClient** (*numeric type asz, numeric type dsz*)

writeReq → Get#(PhysMemRequest#(asz))

writeData → Get#(MemData#(dsz))

```
writeDone → Put#(Bit#(MemTagSize))
```

```
interface MemTypes : :PhysMemReadServer (numeric type asz, numeric type dsz)
```

```
readReq → Put#(PhysMemRequest#(asz))
```

```
readData → Get#(MemData#(dsz))
```

```
interface MemTypes : :PhysMemWriteServer (numeric type asz, numeric type dsz)
```

```
writeReq → Put#(PhysMemRequest#(asz))
```

```
writeData → Put#(MemData#(dsz))
```

```
writeDone → Get#(Bit#(MemTagSize))
```

2.8.4 Memory Clients and Servers

```
interface MemTypes : :MemReadClient (numeric type dsz)
```

```
readReq → Get#(MemRequest)
```

```
readData → Put#(MemData#(dsz))
```

```
interface MemTypes : :MemWriteClient (numeric type dsz)
```

```
writeReq → Get#(MemRequest)
```

```
writeData → Get#(MemData#(dsz))
```

```
writeDone → Put#(Bit#(MemTagSize))
```

```
interface MemTypes : :MemReadServer (numeric type dsz)
```

```
readReq → Put#(MemRequest)
```

```
readData → Get#(MemData#(dsz))
```

```
interface MemTypes : :MemWriteServer (numeric type dsz)
```

```
writeReq → Put#(MemRequest)
```

```
writeData → Put#(MemData#(dsz))
```

```
writeDone → Get#(Bit#(MemTagSize))
```

2.8.5 Memory Engine Types

```
struct MemTypes : :MemengineCmd
```

A read or write request for a MemreadEngine or a MemwriteEngine. Memread and Memwrite engines will issue one or more burst requests to satisfy the overall length of the request.

```
sglId → SGLId
```

Which scatter gather list the MMU should use to translate the addresses

```
base → Bit#(MemOffsetSize)
```

Logical base address of the request, as a byte offset

burstLen → Bit#(BurstLenSize)
Maximum burst length, in bytes.

len → Bit#(32)
Number of bytes to transfer. Must be a multiple of the data bus width.

tag → Bit#(MemTagSize)
Identifier for this request.

2.8.6 Memory Engine Interfaces

interface MemTypes :: **MemwriteServer** (*numeric type dataWidth*)

cmdServer → Server#(MemengineCmd, Bool)

dataPipe → PipeIn#(Bit#(dataWidth))

interface MemTypes :: **MemwriteEngineV** (*numeric type dataWidth, numeric type cmdQDepth, numeric type numServers*)

dmaClient → MemWriteClient#(dataWidth)

writeServers → Vector#(numServers, Server#(MemengineCmd, Bool))

dataPipes → Vector#(numServers, PipeIn#(Bit#(dataWidth)))

write_servers → Vector#(numServers, MemwriteServer#(dataWidth))

typedef MemTypes :: **MemwriteEngineV#** (**dataWidth, cmdQDepth, 1**) **MemwriteEngine#** (*numeric type dataWidth*)

interface MemTypes :: **MemreadServer** (*numeric type dataWidth*)

cmdServer → Server#(MemengineCmd, Bool)

dataPipe → PipeOut#(Bit#(dataWidth))

interface MemTypes :: **MemreadEngineV** (*numeric type dataWidth, numeric type cmdQDepth, numeric type numServers*)

dmaClient → MemReadClient#(dataWidth)

readServers → Vector#(numServers, Server#(MemengineCmd, Bool))

dataPipes → Vector#(numServers, PipeOut#(Bit#(dataWidth)))

read_servers → Vector#(numServers, MemreadServer#(dataWidth))

typedef MemTypes :: **MemreadEngineV#** (**dataWidth, cmdQDepth, 1**) **MemreadEngine#** (*numeric type dataWidth*)

2.8.7 Memory Traffic Interfaces

interface MemTypes :: **DmaDbg**

getMemoryTraffic → ActionValue#(Bit#(64))

dbg → ActionValue#(DmaDbgRec)

2.8.8 Connectable Instances

```
instance MemTypes :: Connectable (MemReadClient#(dsz), MemReadServer#(dsz))
instance MemTypes :: Connectable (MemWriteClient#(dsz), MemWriteServer#(dsz))
instance MemTypes :: Connectable (PhysMemMaster#(addrWidth, busWidth), PhysMemSlave#(addrWidth, busWidth))
instance MemTypes :: Connectable (PhysMemMaster#(32, busWidth), PhysMemSlave#(40, busWidth))
```

2.9 MMU Package

```
typedef MMU :: 32 MaxNumSGLists
typedef MMU :: Bit# (TLog# (MaxNumSGLists)) SGListId
typedef MMU :: 12 SGListPageShift0
typedef MMU :: 16 SGListPageShift4
typedef MMU :: 20 SGListPageShift8
typedef MMU :: Bit# (TLog# (MaxNumSGLists)) RegionsIdx
typedef MMU :: 8 IndexWidth
```

2.9.1 Address Translation

```
struct MMU :: ReqTup
  Address translation request type

  id → SGListId
    Which SGList to use.

  off → Bit#(MemOffsetSize)
    The address to translate.

interface MMU :: MMU (numeric type addrWidth)
  An address translator

  request → MMURequest
    The interface of the MMU that is exposed to software as a portal.

  addr → Vector#(2, Server#(ReqTup, Bit#(addrWidth)))
    The address translation servers

module MMU :: mkMMU (Integer iid, Bool bsimMMap, MMUIndication mmuIndication) →
  (MMU#(addrWidth))
  Instantiates an address translator that stores a scatter-gather list to define the logical to physical address mapping.
  Parameter iid is the portal identifier of the MMURequest interface.
  Parameter bsimMMap ??
```

2.9.2 Multiple Address Translators

```
interface MMU :: MMUAddrServer (numeric type addrWidth, numeric type numServers)
  Used by mkMemServer to share an MMU among multiple memory interfaces.
```

interface Vector ((numServers, Server#(ReqTup, Bit#(addrWidth))) servers)

The vector of address translators.

module MMU : **mkMMUAddrServer** (Server#(ReqTup, Bit#(addrWidth)) server) → (MMUAddrServer#(addrWidth,numServers))

Instantiates an MMUAddrServer that shares the input server among multiple clients.

2.10 Pipe Package

The Pipe package is modeled on Bluespec, Inc's PAClib package. It provides functions and modules for composing pipelines of operations.

2.10.1 Pipe Interfaces

interface Pipe : **PipeIn** (type a)

Corresponds to the input interface of a FIFO.

enq (a v) → Action

notFull → Bool

interface Pipe : **PipeOut** (type a)

Corresponds to the output interface of a FIFO.

first → a

deq → Action

notEmpty → Bool

typeclass Pipe : **ToPipeIn** (type a, type b)

function toPipeIn (b in) → PipeIn#(a)

Returns a PipeIn to the object "in" with no additional buffering.

typeclass Pipe : **ToPipeOut** (type a, type b)

function toPipeOut (b in) → PipeOut#(a)

Returns a PipeOut from the object "in" with no additional buffering.

typeclass Pipe : **MkPipeIn** (type a, type b)

module mkPipeIn (b in) → (PipeIn#(a))

Instantiates a module whose interface is a PipeIn to the input parameter "in". Includes a FIFO buffering stage.

typeclass Pipe : **MkPipeOut** (type a, type b)

module mkPipeOut (b in) → (PipeOut#(a))

Instantiates a module whose interface is PipeOut from the input parameter "in". Includes a FIFO buffering stage.

instance Pipe : **ToPipeIn** (a, FIFO#(a))

Converts a FIFO to a PipeIn.

instance `Pipe::ToPipeOut` (*a*, *function a pipefn()*)
 Converts a function to a PipeOut.

instance `Pipe::ToPipeOut` (*a*, *Reg#(a)*)
 Converts a register to a PipeOut.

instance `Pipe::ToPipeIn` (*Vector#(m, a)*, *Gearbox#(m, n, a)*)
 Converts a Gearbox to a PipeOut.

instance `Pipe::ToPipeOut` (*a*, *FIFO#(a)*)
 Converts a FIFO to a PipeOut.

instance `Pipe::ToPipeOut` (*Vector#(n, a)*, *MIMO#(k, n, sz, a)*)
 Converts a MIMO to a PipeOut.

instance `Pipe::ToPipeOut` (*Vector#(n, a)*, *Gearbox#(m, n, a)*)
 Converts a Gearbox to a PipeOut.

instance `Pipe::MkPipeOut` (*a*, *Get#(a)*)
 Instantiates a pipelined PipeOut from a Get interface.

instance `Pipe::MkPipeIn` (*a*, *Put#(a)*)
 Instantiates a pipelined PipeIn to a Put interface.

2.10.2 Get and Put Pipes

instance `Pipe::ToGet` (*PipeOut#(a)*, *a*)
instance `Pipe::ToPut` (*PipeIn#(a)*, *a*)

2.10.3 Connectable Pipes

instance `Pipe::Connectable` (*PipeOut#(a)*, *Put#(a)*)
instance `Pipe::Connectable` (*PipeOut#(a)*, *PipeIn#(a)*)

2.10.4 Mapping over Pipes

function `Pipe::toCountedPipeOut` (*Reg#(Bit#(n)) r*, *PipeOut#(a) pipe*) → *PipeOut#(a)*

function `Pipe::zipPipeOut` (*PipeOut#(a) ina*, *PipeOut#(b) inb*) → *PipeOut#(Tuple2#(a,b))*
 Returns a PipeOut whose elements are 2-tuples of the elements of the input pipes.

function `Pipe::mapPipe` (*function b f(a av)*, *PipeOut#(a) apipe*) → *PipeOut#(b)*
 Returns a PipeOut that maps the function f to each element of the input pipes with no buffering.

module `Pipe::mkMapPipe` (*function b f(a av)*, *PipeOut#(a) apipe*) → (*PipeOut#(b)*)
 Instantiates a PipeOut that maps the function f to each element of the input pipes using a FIFO for buffering.

function `Pipe::mapPipeIn` (*function b f(a av)*, *PipeIn#(b) apipe*) → *PipeIn#(a)*
 Returns a PipeIn applies the function f to each value that is enqueued.

2.10.5 Reducing Pipes

2.10.6 Functions on Pipes of Vectors

function `Pipe::unvectorPipeOut` (*PipeOut#(Vector#(l, a)) in*) → *PipeOut#(a)*

2.10.7 Funneling and Unfunneling

module `Pipe` : **mkFunnel** (*PipeOut#(Vector#(mk, a)) in*) → (*PipeOut#(Vector#(m, a))*)

Returns k Vectors of m elements for each Vector#(mk,a) element of the input pipe.

module `Pipe` : **mkFunnel1** (*PipeOut#(Vector#(k, a)) in*) → (*PipeOut#(a)*)

Sames as mkFunnel, but returns k singleton elements for each vector element of the input pipe.

module `Pipe` : **mkFunnelGB1** (*Clock slowClock, Reset slowReset, Clock fastClock, Reset fastReset, PipeOut#(Vector#(k, a)) in*) → (*PipeOut#(a)*)

Same as mkFunnel1, but uses a Gearbox with a 1 to k ratio.

module `Pipe` : **mkUnfunnel** (*PipeOut#(Vector#(m, a)) in*) → (*PipeOut#(Vector#(mk, a))*)

The dual of mkFunnel. Consumes k elements from the input pipe, each of which is an m-element vector, and returns an mk-element vector.

module `Pipe` : **mkUnfunnelGB** (*Clock slowClock, Reset slowReset, Clock fastClock, Reset fastReset, PipeOut#(Vector#(l, a)) in*) → (*PipeOut#(Vector#(k, a))*)

The same as mkUnfunnel, but uses a Gearbox with a 1-to-k.

module `Pipe` : **mkRepeat** (*UInt#(n) repetitions, PipeOut#(a) inpipe*) → (*PipeOut#(a)*)

Returns a PipeOut which repeats each element of the input pipe the specified number of times.

2.10.8 Fork and Join

Fork and Join with limited scalability

module `Pipe` : **mkForkVector** (*PipeOut#(a) inpipe*) → (*Vector#(n, PipeOut#(a))*)

Replicates each element of the input pipe to each of the output pipes. It uses a FIFO per output pipe.

module `Pipe` : **mkSizedForkVector** (*Integer size, PipeOut#(a) inpipe*) → (*Vector#(n, PipeOut#(a))*)

Used a SizedFIFO for each of the output pipes.

module `Pipe` : **mkJoin** (*function c f(a av, b bv), PipeOut#(a) apipe, PipeOut#(b) bpipe*) → (*PipeOut#(c)*)

Returns a PipeOut that applies the function f to the elements of the input pipes, with no buffering.

module `Pipe` : **mkJoinBuffered** (*function c f(a av, b bv), PipeOut#(a) apipe, PipeOut#(b) bpipe*) → (*PipeOut#(c)*)

Returns a PipeOut that applies the function f to the elements of the input pipes, using a FIFO to buffer the output.

module `Pipe` : **mkJoinVector** (*function b f(Vector#(n, a) av), Vector#(n, PipeOut#(a)) apipes*) → (*PipeOut#(b)*)

Same as mkJoin, but operates on a vector of PipeOut as input.

2.10.9 Funnel Pipes

Fork and Join with tree-based fanout and fanin for scalability.

These are used by MemreadEngine and MemwriteEngine.

typedef `Pipe` : **Vector#(j, PipeOut#(a))** **FunnelPipe#(numeric type j, numeric type k, type a, nu**

typedef `Pipe` : **Vector#(k, PipeOut#(a))** **UnFunnelPipe#(numeric type j, numeric type k, type a, nu**

typeclass `Pipe` : **FunnelPipesPipelined** (*numeric type j, numeric type k, type a, numeric type bpc*)

module **mkFunnelPipesPipelined** (*Vector#(k, PipeOut#(a)) in*) → (*FunnelPipe#(j,k,a,bpc)*)

```

module mkFunnelPipesPipelinedRR (Vector#(k, PipeOut#(a)) in, Integer c) → (Fun-
    nelPipe#(j,k,a,bpc)

module mkUnFunnelPipesPipelined (Vector#(j, PipeOut#(Tuple2#(Bit#(TLog#(k)), a))) in) →
    (UnFunnelPipe#(j,k,a,bpc)

module mkUnFunnelPipesPipelinedRR (Vector#(j, PipeOut#(a)) in, Integer c) → (UnFun-
    nelPipe#(j,k,a,bpc)

instance Pipe :: FunnelPipesPipelined (1, 1, a, bpc)
instance Pipe :: FunnelPipesPipelined (1, k, a, bpc)

module Pipe :: mkUnFunnelPipesPipelinedInternal (Vector#(1,
    Out#(Tuple2#(Bit#(TLog#(k)), a))) in)
    → (UnFunnelPipe#(1,k,a,bpc)

module Pipe :: mkFunnelPipes (Vector#(mk, PipeOut#(a)) ins) → (Vector#(m, PipeOut#(a))
module Pipe :: mkFunnelPipes1 (Vector#(k, PipeOut#(a)) ins) → (PipeOut#(a))
module Pipe :: mkUnfunnelPipes (Vector#(m, PipeOut#(a)) ins) → (Vector#(mk, PipeOut#(a))
module Pipe :: mkPipelinedForkVector (PipeOut#(a) inpipe, Integer id) → (UnFun-
    nelPipe#(1,k,a,bpc)

```

2.10.10 Delimited Pipes

```

interface Pipe :: FirstLastPipe (type a)
    A pipe whose elements two-tuples of boolean values indicating first and last in a series. The ttype a indicates
    the type of the counter used.

    pipe → PipeOut#(Tuple2#(Bool,Bool))
        The pipe of delimited elements

    start (a count) → Action
        Starts the series of count elements

module Pipe :: mkFirstLastPipe → (FirstLastPipe#(a))
    Creates a FirstLastPipe.

struct Pipe :: RangeConfig#(type a)
    The base, limit and step for mkRangePipeOut.

    xbase → a
    xlimit → a
    xstep → a

interface Pipe :: RangePipeIfc (type a)

    pipe → PipeOut#(a)
    isFirst → Bool
    isLast → Bool
    start (RangeConfig#(a) cfg) → Action

module Pipe :: mkRangePipeOut → (RangePipeIfc#(a))
    Creates a Pipe of values from xbase to xlimit by xstep. Used by Memread.

```

2.11 Portal Package

2.11.1 PipePortal Interface

interface Portal : **PipePortal** (*numeric type numRequests, numeric type numIndications, numeric type slaveDataWidth*)

messageSize (*Bit#(16) methodNumber*) → Bit#(16)
Returns the message size of the methodNumber method of the portal.

requests → Vector#(numRequests, PipeIn#(Bit#(slaveDataWidth)))

indications → Vector#(numIndications, PipeOut#(Bit#(slaveDataWidth)))

2.11.2 MemPortal Interface

interface Portal : **MemPortal** (*numeric type slaveAddrWidth, numeric type slaveDataWidth*)

slave → PhysMemSlave#(slaveAddrWidth,slaveDataWidth)

interrupt → ReadOnly#(Bool)

top → WriteOnly#(Bool)

function Portal : **getSlave** (*MemPortal#(_a, _d) p*) → PhysMemSlave(_a,_d)

function Portal : **getInterrupt** (*MemPortal#(_a, _d) p*) → ReadOnly#(Bool)

function Portal : **getInterruptVector** (*Vector#(numPortals, MemPortal#(_a, _d)) portals*) → Vector#(16,ReadOnly#(Bool))

2.11.3 ShareMemoryPortal Interface

interface Portal : **SharedMemoryPortal** (*numeric type dataBusWidth*)
Should be in SharedMemoryPortal.bsv

readClient → MemReadClient(dataBusWidth)

writeClient → MemWriteClient#(dataBusWidth)

cfg → SharedMemoryPortalConfig

interrupt → ReadOnly#(Bool)

2.11.4 ConnectalTop Interface

interface Portal : **ConnectalTop** (*numeric type addrWidth, numeric type dataWidth, type pins, numeric type numMasters*)

Interface ConnectalTop is the interface exposed by the top module of a Connectal hardware design.

slave → PhysMemSlave#(32,32)

masters → Vector#(numMasters,PhysMemMaster#(addrWidth, dataWidth))

interrupt → Vector#(16,ReadOnly#(Bool))

leds → LEDS

pins → pins

2.11.5 StdConnectalTop Typedef

typedef Portal :: **StdConnectalTop** (numeric type addrWidth) → Connectal-
Top##(addrWidth,64,Empty,0)

Type StdConnectalTop indicates a Connectal hardware design with no user defined pins and no user of host shared memory. The “pins” interface is Empty and the number of masters is 0.

typedef Portal :: **StdConnectalDmaTop** (numeric type addrWidth) → Connectal-
Top##(addrWidth,64,Empty,1)

Type StdConnectalDmaTop indicates a Connectal hardware design with no user defined pins and a single client of host shared memory. The “pins” interface is Empty and the number of masters is 1.
